I deeply apologize for having to break this paper in to 2 parts however sometimes this happens.

In short after experimenting, talking I have concluded that as we grow older we are suffers of pain and some are more sensitive to events that happen around us.

Most of us know when "a storm is brewing" are when it's becoming colder.

My reasoning behind this is that other animal feel the same way we do. The shark, due to the

squalene and Pristane In its body Feels the storm as it approaches and moves away to a much more safer place are feels the cold and moves to warmer parts. I would say and have seen this happen in other animals such as birds' the list goes on what's to say the reasoning behind there moving are migration is what we would call pain.
